AQUAKURE

A Aqua Feed Probiotic Product

Maintaining a clean and healthy pond can be challenging, but AquaKure makes it easier than ever! Our Bacillus-based formula is specifically designed to promote a balanced ecosystem in your pond by breaking down organic matter and reducing unwanted odors.

AquaKure can be used in both fresh and sea water. The activity of the Bacillus in it keeps the water quality optimal, stabilizing the phytoplankton bloom. Rapid decomposition of waste material which helps control pathogenic bacteria in ponds. The product reduces the development of blue-green algae, improve rearing conditions greatly reduce the risk of off-flavor.

Key Benefits

Eco-Friendly & Natural: Made with a natural blend of Bacillus bacteria and a high-performance probiotic mix, that work to reduce algae, sludge, and excess nutrients.

Improves Water Quality: Helps maintain clear water by digesting organic waste and reducing ammonia, nitrates, and phosphates. Rapidly breaks down waste on pond bottom.

Odor Control: Effectively eliminates foul odors by breaking down the substances that cause them.

Supports Healthy Fish & Plants: Provides a healthier environment for shrimps and aquatic plants by balancing the pond's natural ecosystem. Stabilizes phytoplankton bloom.

Reduces Maintenance: Minimizes the need for frequent pond cleaning and maintenance, saving time and effort. Keeps water quality optimal.

Phytoplankton bloom stabilization

The Bacillus of AquaKure digests the suspended organic matter leading to better rearing conditions. Here below in super-intensive Litopenaeus vannamei farm, the treated ponds release light-green effluent (better bloom) than the control pond whose dark water is associated with sulphide-rich anaerobic soil (and bad bloom).

Effluent from control pond

Water quality optimization

With less suspended organic matter, better phytoplankton blooms and balanced biochemical composition, the water quality optimizes conditions for animals' welfare and good health status.

Off-flavor reduction

Field feedback shown elimination of off-flavour and improvement of marketable quality.

Storage

- Store in a cool, dark, dry place. Close the container after opening. Shelf life: 24 months.

Ingredients

- Strains of Bacillus, bacterial growth media, specific nutrients.
- Concentration of bacteria: minimum 5 x 1010 CFU/g.

How it work

Bacillus bacteria are naturally occurring microorganisms that act as powerful biodegraders. Once introduced into your pond, these bacteria go to work by

- Breaking down organic matter such as fish waste, uneaten food, and dead plant material.
- Reducing the buildup of sludge and debris on the pond bottom.
- Stabilizing nutrient levels to prevent algae overgrowth.

Application Instructions

Application AquaKure @ 200g per hectare.

- Calculate the total amount of AquaKure for the required application.
- Shake Well: Ensure the product is well-mixed before use.
- Mix AuqaKure with pond water in a bucket and let it stand for 1 hour.
- Distribute evenly over the pond with the aerators running (or when wind mixing occurs).
