EASY KRISHI

GUTKURE

A Aqua Feed Probiotic Product

Gutkure from EasyKrishi, is an aqua feed probiotic product that is Bacillus-based that are commonly used in aquaculture to enhance digestion and boost the immune systems of fish and shrimp. Bacillus species are highly effective because of their spore-forming ability, which makes them stable under various environmental conditions, including in aquatic systems

The product is developed as an advanced tool, targeting the colonization of the live feed & fish tanks. Together with optimal feeds, feeding regimes and correct zoo-technical management, it is established by applying Gutkure has proven to be effective in production of high-quality fry, which is necessary to improve the overall performance and robustness during pre-on growing and grow-out.

GUTKURE

Key Benefits

Water Quality Improvement

Reduction of Ammonia and Nitrite: Bacillus species help in the breakdown of organic matter, reducing harmful ammonia and nitrite levels.

Maintenance of Water Clarity: They help reduce organic waste, leading to clearer water.

Gut Health and Digestion

Enhanced Digestion: Bacillus enzymes (such as proteases, amylases, and cellulases) help digest proteins, carbohydrates, and other nutrients, leading to better feed conversion rates.

Improved Nutrient Absorption: The production of digestive enzymes aids in the better assimilation of nutrients by aquatic animals.

Disease Resistance

Pathogen Suppression: Bacillus species can outcompete harmful pathogens (like Vibrio) by producing antimicrobial substances or through competitive exclusion, reducing the risk of disease.

Boosted Immune Response: They can enhance the immune response of fish and shrimp, making them more resilient to diseases.

Stress Resistance

Bacillus probiotics can help aquatic animals cope with stressful conditions such as fluctuations in temperature, salinity, or stocking density..

Controlpond

Trialpond

Gutkure improves nutrients assimilation through exoenzymes production, resulting in faster growth (ADG), optimized feed efficiency (FCR) and better size homogeneity

Use & Storage

Application in Larval Rearing Tank & Nursery

- One day before stocking, apply Gutkure probiotic at 2g/m3 of fish culture water.
- After stocking, apply Gutkure probiotic at a daily dose of 1g/m3 of fish culture water, at any water exchange rate.
- For each tank, mix required amount of Gutkure probiotic with small volume of water

Application in Rotifers

- After Rotifers enrichment, harvest, rinse and concentrate up to a density between 5,000 — 10,000 Rotifers/ml.
- Treat with Gutkure probiotic at 2.5g/Liter for 20min.
- Rinse and feed the fish larvae or stock in cold storage (8°Q) for the rest of the day

Application in Artemia

- After Artemia enrichment, harvest, rinse and concentrate up to a density of 5,000 npl/ ml
- Treat with Gutkure probiotic at 2.5q/Liter for 20min.
- Rinse and feed the fish larvae or keep in cold storage (8°C) for the rest of the day.

Ingredients

Strains of Bacillus, bacterial growth media, specific nutrients. Concentration of bacteria is minimum 5 x 10 CFU/g.

Attention

Do not use it with antibiotics and disinfectant products at the same time. Discard container properly after use. Avoid contact with eyes, skin or opened wounds. Wash hands with warm, soapy water after handling.

Storage

Store in a cool, dark, dry place. Close the container after opening. Shelf life: 24 months.
